

Your AWS bill is growing. The question is whether it's **funding progress** or quietly paying for **waste**.

The goal is not a smaller AWS bill. It's a better use of every dollar released from it.

Ignite is VeUP's zero-cost AWS growth accelerator that turns the AWS spend you already have into the starting point for your next stage of growth. FinOps, cloud optimization, AI readiness assessment, and AWS funding guidance in one engagement, delivered by people, *not a dashboard*. You'll get a board-ready view of your cloud economics and a technical path to the work that matters next.

Four things Ignite does in 30 days

Cloud Reclaim

01

We review your AWS environment and identify where spend is recoverable. The point is to understand what is genuinely idle, overprovisioned or misaligned.

See the true cost

02

Access to VeUP's FinOps platform, Umbrella. Deeper visibility than AWS Cost Explorer. What is this spend actually buying, and who owns it.

Know whether AI can ship

03

AI does not become production-ready because the model works in a demo. We review your environment against Well-Architected considerations and tell you what needs to be true before production.

Find the funding route

04

We identify potential AWS funding routes that may support your technical roadmap. Ignite makes the route visible.

What Ignite gives you by Day 30

You start with	You leave with
 A rising AWS bill	 A clear view of what is driving it
 Scattered cost data	 Resource, account and service-level visibility
 AI ambition	 A practical readiness assessment and technical path
 Unclear funding options	 A view of potential AWS funding routes
 A long technical roadmap	 A prioritized next step
 A finance and engineering gap	 A shared business case

Ignite in one sentence: We find the money, explain the environment and write the next build.

Where Ignite creates value

- AWS spend is rising faster than the business**
 You know the bill is growing, but not which workloads, teams or environments are responsible. Ignite identifies **cost drivers**, prioritizes potential savings and creates a clearer ownership model.
- You are in the middle of a migration or acquisition**
 Parallel environments, migration workloads and temporary infrastructure become permanent cost if nobody establishes a baseline early. Ignite identifies what belongs to the integration, what belongs to the existing business and what can be removed or optimized.
- Your cloud estate has outgrown your FinOps process**
 Multiple accounts, regions, teams or clouds without reliable allocation, tagging or forecasting. Ignite gives Finance and Engineering a shared view of the environment and a practical governance roadmap.
- You have a strategic project but no obvious budget**
 You want to fund an AI, data, migration or infrastructure project without asking for more budget. Ignite identifies recoverable spend and assesses whether an AWS funding route may help offset the next phase.
- AI workloads are becoming real**
 AI training, inference, data and evaluation workloads create variable costs that appear long after the original deployment decision. Ignite establishes visibility before AI spend becomes an unexplained monthly surprise.
- Finance and Engineering are having the same conversation in different languages**
 Finance sees variance. Engineering sees infrastructure complexity. Leadership sees a number that keeps increasing. Ignite gives all three teams a shared view of the problem and the next action.

FAQs

Is Ignite really zero cost?

Yes. Our costs are covered through VeUP's AWS reseller relationship. The billing structure and customer-specific terms are explained before onboarding.

Do we lose our AWS Account Manager?

No. Ignite works alongside your existing AWS relationship. You keep your Account Manager, Solutions Architect and AWS console access.

Do we need to move our AWS billing to VeUP?

Onboarding may require a change to the relevant billing relationship. You retain full control of your AWS environment and account access. Review the exact structure with your Finance, Procurement and AWS teams before proceeding.

Do you need access to our production environment?

The initial analysis focuses on billing, cost and agreed technical information. We do not require root credentials. IAM, billing, CUR and SSO permissions are agreed with your security or vendor-risk team before onboarding.

How much time will our team need to provide?

Lightweight. We need an onboarding session, billing and account information, Finance and Engineering contacts, context on major workloads and upcoming projects, and review time for findings. Ignite runs alongside existing work rather than creating another project for your engineering team.
